No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Application US/08225224
Patent No. 563599
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: PASTAN, Ira
PAPLICANT: RESTAN, Robert J.
TITLE OF INVENTION: CIRCULARLY PERMUTATED LIGANDS AND
TITLE OF INVENTION: CIRCULARLY PERMUTATED LIGANDS AND
TITLE OF INVENTION: CIRCULARLY PERMUTED FUSION PROTEINS
NUMBER OF SEQUENCES: 5
CORRESPONDENCE ADDRESS:
STREET: Steuart Street Townsend Khourie and Crew
STREET: Steuart Street Tower, One Market Plaza

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                            1. New peptides derived from Interleukin 2 designated IP130 and IP131 are useful as therapeutic agents in the treatment of patients deficient in
                                                                                                                                                                                               terminal portion corresponding essentially to the AA sequence of interleukin-2 (IL-2) but contg. less than 100 AAs. The IL-2 sequence is coded for by 1,2 or 3 of the A-F segments of the IL-2 gene having the formula: (EcoR1)-A-PStI-B-MIUI-C-Xbal-D-SacI-E-Pvul-F-(SaII), for example, the sequence in AAN/70921. The segments are joined in any appropriate sequence and opt. connected by usual adaptors or linkers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is the protein sequence for IP131 D20K. The sequence is based on the human interleukin-2 (IL-2) peptide IP130 (see ABN84292) by the addition of a C-terminal Tyr residue, and substitution of the native Asp-20 residue by Lys. Asp-20 is located in a region of IL-2 that directly influences interaction of
                  New fusion protein contg. small interleukin 2 ballast fragments allowing control of product solubility, and corresp. genes, vectors and transformed host cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        IP131; interleukin-2; human; gene; gene therapy; mutant; mutein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                            The present sequence is the protein sequence for IP131 D20K. The sequence is based on the human interleukin-2 (IL-2) peptide IP130 (see ARN84292) by the addition of a C-terminal Tyr residue, and substitution of the native Asp-20 residue by Lys. Asp-20 is constitution of the native Asp-20 residue by Lys. Asp-20 is located in a region of IL-2 that directly influences interaction of the cytokine with its receptor (IL-2R). An antibody that binds to the peptide is claimed, and is preferably an antibody produced by ybridoma H2-8 (CNCM No. I-2338). A claimed method of detecting the presence or activity of involves contacting a sample with IP131 D20K, and detecting whether binding occurs. A claimed method for inducing IL-2 activity in a patient comprises administering IP131 D20K to the patient. A vector comprises administering IP13 D20K to the patient. A vector comprises administering in PD131 D20K but containing DNA encoding the peptide is claimed, and is used in a claimed method for treating a patient delicient in IL-2 activity. Also claimed method for treating a patient delicient in IL-2 activity. Also claimed method for the patient delicient in IL-2 activity. Also claimed are peptides corresponding to IP131 D20K but containing conservative amino acid substitutions, i.e. change of uncharged polar R-groups by tother uncharged polar R-groups by Lys, Asp by Glu. Thr by Ser. or Asn by Gln, and vice versa. The peptide induces SHC phosphorylation or induction of the SHC/MARK pathway. Antibodies specific for the mumic popular or popular in the section of the section 
                                                                     New peptides derived from Interleukin 2 designated IP130 and IP131 are useful as therapeutic agents in the treatment of patients deficient in

the cytokine with its receptor (IL-2R). An antibody that binds to the peptide is claimed, and is preferably an antibody produced by hybridoma H2-8 (CNCM NO. I-2338). A claimed method of detecting the presence or activity of involves contacting a sample with containing D120K, and detecting whether binding occurs. A claimed method for involves contacting IL-2R with the peptide. A claimed method for inducing IL-2 activity in a patient comprises administering IP31 D20K to the patient. A vector containing DNA encoding the peptide is claimed, and is used in a claimed method for treating a patient deficient in IL-2 activity. Containing conservative amino acid substitutions, i.e. change of non-polar R-groups but other non-polar R-groups, change of non-polar R-groups by other uncharged polar R-groups, substitution of Arg by Lys, Asp by Glu, Th by Ser, or Ash by Glu, and vice versa. The peptide induces SHC phosphorylation or induction of the SHC/MARK pathway. Antibodies specific for the peptide are useful for treatment or prevention of undesirable immune reactions such as grathfitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; interleukin-2; IL-2; IL-2 mutein; HIV; cancer; renal carcinoma;

AAY53822-66 represent human interleukin-2 (IL-2) muteins, where human interleukin-2 (IL-2 has been substituted at one of positions 20, 88 or 126. Wild-type IL-2 has been substituted at one of positions 20, 88 or 126. Wild-type CIL-2, when used in cancer treatment, has adverse side effects. The toxicities associated with IL-2 therapy include severe fever, nausea, omiting, vascular leak and serious hypotension. The muteins described in this invention have reduced toxicity and are better tolerated. It is the mediation of IL-2 through natural killer cells which causes the efficacy is mediated by the direct activation of T cells. The muteins preferentially activate T cells which causes the cells. IL-2 muteins may be used for treating a mammal afflicted with an IL-2 treatable condition. The condition may be one of the following:

HIV, cancer including renal carcinoma and malignant melanoma, autoimmune disease, infectious disease, immune deficiency including SCID or other therapeutic application requiring general stimulation of the immune such as tuberculosis and as an adjuvant in cancer vaccine strategy. The DNA sequences encoding the IL-2 mutein may be used in gene therapy of applications in those diseases in which IL-2 is expected to provide an effective therapy due to its T cell activity.

Cusing information provided and the wild type IL-2 sequence (see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

Resonances between coding and non-coding regions were measured for the native human IL-2 gene in plasmid pT911 (see AA055630) and a synthetic IL-2 gene (AA055639) in which alternative, degenerate codons were used in order to introduce additional restriction sites. It was found that the degenerate changes greatly upset the "natural order" between coding and non-coding regions; as a result, the amount of protein expressed by the degenerate gene is likely to be adversely affected. The inventors have proposed an "optimised" il.2 gene with the aim of increasing the amount of protein expressed by the gene. (N.B. the sequence is also described as

The plasmid may be used to transform an expression system giving a fusion protein which may be used as a diagnostic agent for bowine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                 24
The sequence corresponds to the first 58 amino acid residues of human IL-2. It forms part of a fusion protein, linked to a heterologous protein. The heterologus protein is preferably gap or a fragment of gp 41 of HIV-1 or it is a fragment of gp 36 of HIV-2. Such fusion proteins can be used to detect antibodies to these proteins. to the general formula R2-R1-(B2-B29)-Y-X-Gly-(A2-A20)-R3 (II). In formula (II), X = Lys, Arg or a peptide of 2-35 amino acids contg. Lys or Arg at the N- and C-termini; Y = a natural amino acid; R1 = phe or a bond; R2 = H, Arg, Lys, a peptide of 2-45 amino acid; R1 = contg. Arg or Lys at the N- and C-termini; R3 = a natural amino acid; (A2-A20) and (B2-B29) are the insulin A- and B-chain sequences from human or other insulin. The proinsulin molecule, released by residues of mercaptan per Cys residue of proinsulin. The reaction

                                                                                                                                                                                                                                                                                                                     Pro-insulin is produced by treating recombinant precursor protein with a mercaptan to provide 2-10 SH residues per Cys residue, in presence of a chootropic agent and in aq. medium of pH 10-11, treating the prod. with 3-50 g hydrophobic adsorber resin per 1 aq. medium of pH 4-7, isolating the adsorbed resin and pro-insulin and desorbing the pro-insulin. This method produces pro-insulin and correctly bonded Cys bridges. Compared with known methods it involves fewer stages (esp. no sulphitolysis or cyanogen bromide cleavage) and overall losses during purification are reduced, i.e. the process is quitcker and gives better yields. Sequences of insulin chain Ab B and C are given in AAR68895-97.
                                                                                                                                                                                     Prodn. of pro-insulin with correct di:sulphide bridges - by treating recombinant precursor protein with mercaptan in alkali and in presence of chaotropic agent, then isolation on hydrophobic resin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The DNA sequence is esp. selected from a human chromosomal gene bank, e.g. it is a hIL-2 related portion of lamda CH4A-ghIL-2-1 or -2, or of lamda L47-ghIL-2-1, -2 or -3. Transformed hosts are also claimed, esp. E.coli, Ps Spp., B.subtilis, B.stearothermophilus. IL-2-like polypeptides are also claimed.

                                                                                                                               The interleukin-2 protein is part of a hybrid protein comprising the binding domain of IL-2 and an enzymatically inactive fragment of diphtheria toxin which does not include a functional Dr. of diphtheria toxin which does not include a functional Dr. of eneralised eukaryotic binding site (see AAR26486). The hybrid protein is capable of stimulating the proliferation of peripheral blood mononuclear cells in vitro and of suppressing an immune response in a mammal in vivo. The hybrid protein allows the inhibition of an unwanted immune response such as autoimmune disease, e.g. diabetes and rheumatoid arthritis, or allograft rejection. It does not cause general immunosuppression, so avoids the resulting risk of life threatening infections. In the treatment of allograft rejection the hybrid protien spares donor-specific T-suppressor cells, which can thus proliferate and aid in prolonging graft survival. The hybrid protien does not need to be tailored to individual patients but can be used as a universal inhabiting agent. Therapy need not be

DNA SQs coding for AAs 1-133 and 0-133 (an additional Met) of IL-2 are claimed, including the CDS of SQ I (see AANSO037) with/without 1 or 2 stop codons. The use of a synthetic gene is esp. convenient for expression in E. coli and allows modification of the AA SQ to improve peptide stability, solubility or activity. The synthetic gene was made from a series of oligonucleotides ligated to form four larger fragments designated IL 2-I to 2-IV (see AANSO038). (Updated on 16-AUG-2002 to add missing OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The inventors claim a method for the prodn. of a substance having the AA SQ of AAP61102. The method uses a synthetic DNA SQ (AAN60198). A composition contg. a protein having human IL2 activity which is produced by the method is also claimed. The method uses yeast transformed by a secretory expression vector.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

A; Residues: 21-153 <ROB>
A; Residues: 21-153 <ROB>
A; Note: disulfide bonds and carbohydrate binding site were determined
A; Note: heterogeneity in Jurkat-derlyed IL-2 is primarily due to differences in glycosyl
n in lacking 21-Ala (FT-I12-A and FT-IL2-B) and 22-Pro (FT-IL2-B)

C Structure 2:839-851(1994).

C -1- FUNCTION: PRODUCED BY T-CELLS IN RESPONSE TO ANTIGENIC OR MITOGENIC STIMULATION, THIS PROTEIN IS REQUIRED FOR T-CELL PROLIFERATION AND OTHER ACTIVITIES CRUICAL TO REGULATION OF THE IMMUNE RESPONSE. CAN STIMULATE B CELLS, MONOCYTES, LYMPHOKINE-CATIVITIES CRUICAL TO REGULATION OF THE IMMUNE RESPONSE. CAN STIMULATE B CELLS, MONOCYTES, LYMPHOKINE-CATIVITIES CELLS, AND GLIOMA CELLS.

C -1- SUBGELIULAR LOCATION: Secreted.

C -1- DISEASE: A FORM OF T-CELL ACUTE LYMPHOBLASTIC LEUKEMIA (T-ALL) IS CHARACTERIZED BY A CHROMOSMAL TRANSLOCATION T(4:16)(Q26:P13)

CC -1- PHARMACCUTICAL: Available under the name Proleukin (Chiron). Used in patients with renal cell carcinoma or metastatic melanoma.

CC -1- SIMILARITY: BELONGS TO THE IL-2 FAMILY.

CC -1- SIMILARITY: BELONGS TO THE IL-2 FAMILY.

                                                                                                                                                                                                                                                        J. Immunol. 155:3946-3954(1995).

-!- FUNCTION: PRODUCED BY T-CELLS IN RESPONSE TO ANTIGENIC OR MITOGENIC STIMULARION, THIS PROTEIN IS REQUIRED FOR T-CELL. PROLIFERATION AND OTHER ACTIVITIES CRUCIAL TO REGULATION OF THE IMMUNE RESPONSE. CAN SITMULATE B CELLS, MONOCYTES, LYMPHOKINE-ACTIVATED KILLER CELLS, NATURALE B CELLS, AND GLIOMA CELLS.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: BELONGS TO THE IL-2 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .) MIDGENIG Of the canine interleukin-2-encoding cDNA.";

Gene 159:281-282(1995).

-!-FUNCTION: PRODUCED BY T-CELLS IN RESPONSE TO ANTIGENIC OR

MITOGENIC STIMULATION, THIS PROTEIN IS REQUIRED FOR T-CELL

PROLIFERATION AND OTHER ACTIVITIES CRUCTAL TO REGULATION OF THE

INMUNE RESPONSE. CAN STIMULATE B CELLS, MONOCYTES, LYMPHOKINE-

ACTIVATED KILLER CELLS, NATURAL KILLER CELLS, AND GLIOMA CELLS.

-!- SUBCELLULAR LOCATION: Secreted.

-!- SIMILARITY: BELONGS TO THE IL-2 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Oryctolagus cuniculus (Rabbit).

MITOGENIC STIMULATION, THIS PROTIEN IS REQUIRED FOR T-CELL
PROLIEBRATION AND OTHER ACTIVITIES CRUCIAL TO REGULATION OF THE
IMMUNE RESPONSE. CAN STIMULATE B CELLS, MONOCYTES, LYMPHOKINE-
ACTIVATED KILLER CELLS, NATURAL KILLER CELLS, AND GLIOMA CELLS.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: BELONGS TO THE IL-2 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Meriones unguiculatus (Mongolian jird) (Mongolian gerbil).

submitted (DEC-1989) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: PRODUCED BY T-CELLS IN RESPONSE TO ANTIGENIC OR
MITOGENIC STIMULATION, THIS PROTEIN IS REQUIRED FOR T-CELL
PROLIFERATION AND OTHER ACTIVITIES CRUCIAL TO REGULATION OF THE
IMMUNE RESPONSE. CAN STIMULATE B CELLS, MONOCYTES, LYMPHOKINE-
ACTIVATED KILLIER CELLS, NATURAL KILLER CELLS, AND GLIOMA CELLS.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: BELONGS TO THE IL-2 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Bos taurus (Bovine).

Submitted (DEC-1996) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: PRODUCED BY T-CELLS IN RESPONSE TO ANTIGENC OR
MITOGENIC STIMULATION, THIS PROTEIN IS REQUIRED FOR T-CELL
PROLIFERATION AND OTHER ACTIVITIES CRUCIAL TO REGULATION OF THE
IMMUNE RESPONSE. CAN STIMULATE B CELLS, MONOCYTES, LYMPHOKINE-
ACTIVATED KILLER CELLS, NATURAL KILLER CELLS, AND GLIOMA CELLS.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: BELONGS TO THE IL-2 FAMILY.
                                                                                                                                                                                                                       O-LINKED (GALNAC. .) (BY SIMILARITY)
